1 Release arm
2 Sealing ring

A Release position
B Assembly position

P47.25-0212-03

P47.25-0213-03

ℹ The low pressure lines of the fuel system have plug connections with a release arm (1) in place of screw connections.
The lines are sealed by means of a seal (2).

Disconnecting

1 Press the release arms (1) down to the stop in release position as shown in picture A (arrow).

2 Disconnect connector on low-pressure line.

3 Pull back the release arms (1) again immediately to the stop into the assembly position as shown in picture B (arrow).
The release arms (1) must not be kept over a long period in the release position (A) otherwise leaks can occur due to deformation of the low-pressure line.

Attaching

4 Check whether the release arm (1) is in the installed position (b).
If the release arms (1) were kept for a long time in the release position (A) the low-pressure line must be replaced otherwise leaks can occur due to deformation of the low-pressure line.

5 Insert connector on low-pressure line.

6 Ensure that the connector is firmly seated and free of leaks.
